**RE: Intersection Review**  
**Abercorn Street at Sweetwater Station Drive/Pine Grove Drive**  
**Savannah, GA**

Dear Mr. McKenzie:

As requested, Encroachment Permit Clearinghouse (EPC) has reviewed the current operations of the four-legged signalized intersection of Abercorn Street (SR 204) at Sweetwater Station Drive/Pine Grove Drive. Additionally, this memo conducts a trip generation analysis for the expansion of the Sweetwater Station neighborhood to define the volume of traffic expected to be generated by the planned expansion of 63 single-family residential units to the sub-division. The following provides a summary of this study's findings.

## **PROJECT DESCRIPTION**

Sweetwater Station is an existing residential sub-division/neighborhood located on the south side of SR 204 between the interchanges with King George Boulevard and Ogeechee Road. Sweetwater Station currently contains 306 single-family units and is provided a single access to/from SR 204 via a signalized intersection. Currently there are 118 approved units that are not yet constructed/occupied which will bring the total unit count to 424 units. No other access drives are available as railway lines exist to both the east and west sides of the neighborhood. **Figure 1** illustrates the general regional location of the project.

The eventual plan is to add 63 lots to the neighborhood along the southeastern side abutting Club House Drive and at the southwestern end of Iron Horse Spur (northwest of railway). **Figure 2** illustrates the over-all Sweetwater Master Plan as well as the proposed area of the 63 units.

The main purpose of this memorandum is to review the existing operations of the SR 204 at Sweetwater Station intersection and determine operational characteristics and if signal timing (soft) improvements would aid in operations.

## EXISTING CONDITIONS

A comprehensive field inventory of the project study area was conducted in mid-June 2021 for the SR 204 at Sweetwater Station Drive/Pine Grove Drive intersection. This peak-hour volume data will be used to determine the volume of existing traffic at the study area intersection and operations/levels of service. It should be noted that there has not been a “Covid-19” adjustment to the existing traffic volumes based on recent comparisons of traffic volumes in the area which indicate that traffic volumes are back to pre-Covid levels.

### Site-Generated Traffic

For purposes of defining the potential added traffic to the SR 204 at Sweetwater Boulevard intersection, two steps have been completed; first traffic expected to be generated by the 118 approved (not yet constructed) units has been added to the existing traffic. Second, future traffic due to the 63 single family units, was forecasted and also added to the existing plus approved. Trip generation estimates for both the approved 118 units and additional 63 units are presented in **Table 1**.

**Table 1**  
**TRIP GENERATION SUMMARY<sup>1</sup>**  
*Sweetwater Station*

Time Period	118 Single-Family Units Approved	Single-Family 63 Units
<b>Weekday Daily</b>	1,110	600
<b>AM Peak-Hour</b>		
Enter	22	12
Exit	<u>67</u>	<u>38</u>
Total	89	50
<b>PM Peak-Hour</b>		
Enter	75	41
Exit	<u>44</u>	<u>24</u>
Total	119	65

1. ITE *TRIP GENERATION* 10th Ed. LUC #210

(Single-Family detached).

As shown, the approved 118 units can be expected to generate a total of 89 AM peak-hour trips (22 entering and 67 exiting) and during the PM peak-hour a total of 119 trips (75 entering, 44 exiting). These trips have been assigned to the intersection’s existing traffic volumes based on the current distribution of traffic entering and exiting Sweetwater Station Drive.

The proposed addition of 63 units can be expected to generate 600 daily two-way trips with a total of 50 trips during the AM peak-hour (12 entering, 38 exiting). During the PM peak-hour, 65 trips are expected (41 entering, 24 exiting).

## TRAFFIC OPERATIONS

### Analysis Methodology

A primary result of capacity analysis is the assignment of Level-of-Service (LOS) to traffic facilities under various traffic flow conditions. The concept of Level-of-Service is defined as a qualitative measure describing operational conditions within a traffic stream and their perception by motorists and/or passengers. A Level-of-Service designation provides an index to the quality of traffic flow in terms of such factors as speed, travel time, freedom to maneuver, traffic interruptions, comfort, convenience, and safety.

Six Levels-of-Service are defined for each type of facility (signalized and unsignalized intersections). They are given letter designations from A to F, with LOS A representing the best operating conditions and LOS F the worst.

Since the Level-of-Service of a traffic facility is a function of the traffic flows placed upon it, such a facility may operate at a wide range of Levels-of-Service depending on the time of day, day of week, or period of a year.

### Analysis Results

As part of this TIAS, capacity analyses have been performed at the study area intersection under Existing “plus approved 118 units” conditions and Existing plus approved plus the additional 63 units. The results of these analyses are summarized in **Table 2**.

**Table 2**  
**LEVEL-OF-SERVICE SUMMARY<sup>1</sup>**  
*Sweetwater Station*

<u>Signalized Intersection</u>	Time <u>Period</u>	<b>EXISTING + 118 Approved Units</b>		<b>EXISTING + 118 Units + 63 Units</b>	
		<u>Delay<sup>2</sup></u>	<u>LOS<sup>3</sup></u>	<u>Delay<sup>2</sup></u>	<u>LOS<sup>3</sup></u>
SR 204 at Sweetwater Station Drive/ Pine Grove Drive	AM	<b>61.4</b>	E	<b>63.3</b>	E
	PM	29.6	C	33.4	C

1. Calculations completed using 6th Edition of the HCM.

2. Delay in seconds-per-vehicle.

3. LOS = Level-of-Service.

#### GENERAL NOTES:

For signalized intersections, Delay is representative of the average of all approaches.

As shown in Table 2, Existing plus approved conditions, the signalized intersection of SC 204 at Sweetwater Station Drive operates at a LOS E during the AM peak-hour and a LOS C during the PM peak-hour. Further review of these analyses indicate that the capacity issues are the minor street movements (NB & SB Sweetwater Station Dr/Pine Grove Dr) as well as the major street (EB & WB SC 204) left-turn movements. This combined with the high volume of through traffic on SC 204 (directional peak-hour volumes are greater than 2,600 vehicles) which are being served by two through lanes results in the operations presented.

The second column of values accounts for the addition of the 63 planned units which continue to result in a LOS E during the AM peak-hour (delay=63.3-sec) and a LOS C during the PM peak-hour (delay=33.4 sec.). Based on this a slight increase in delays can be expected at this intersection during both peak hours due to the 63-unit addition.

## SUMMARY

As indicated, the main issue at the SC 204 at Sweetwater Station Drive intersection is the through capacity of SC 204 combined with the high peak-hour volumes. Assuming traffic generated by the 63 single-family units, operations will be slightly impacted during both peak-hours. Traffic generated by the project will not significantly impact the eastbound and westbound through movements of SC 204 but will add traffic to the movements entering and exiting the Sweetwater Station Drive approach.

Review of the operations for the subject intersection do not indicate any "soft" improvements available to improve operations at this time. Operations with the addition of the volumes expected to be generated by the additional 63 units are not expected to significantly change the present service levels as the small increment of added traffic will affect the entering and exiting movements to/from Sweetwater Station Drive. Service levels E and C continue to be expected with the addition of the 63 units.

If operations during the AM peak-hour are to improve, physical improvements would be needed for the intersection however, minor street(s) enhancements will not gain a significant improvement in operations. The existing geometry for the Sweetwater Station Drive approach is more than adequate for the current traffic loadings. The main capacity issue is the existing cross-section of SC 204 being a four-lane divided cross-section that currently serves approximately 45,000 vehicles per-day (based on PM peak-hour counts and TADA stations #051-0321 & 051-0323).

If you have any questions or comments regarding any information contained within this memo, please contact me at (803) 361 3265.

Regards,

Todd E. Salvagin, Principal
